

Botter.

**A compiler for agents written
in plain English.**

356 KB one executable
1.2 ms to start
0 dependencies

 THE PROBLEM

Agents are still glue code.

Hand-written Python around an LLM, plus a framework, an interpreter and a pile of dependencies to ship.

THE IDEA

Write an agent like you write a program. In English.

```
graph LR; A["myagent/  
Markdown, in plain English"] --> B["botter  
The compiler"]; B --> C["myagent.bot  
One static executable"]
```

myagent/

Markdown, in plain English

botter

The compiler

myagent.bot

One static executable

THE SOURCE

Four kinds of plain text.

In a folder, under git,
reviewed in pull requests.

agent.md

Who it is

FLOW.md

What it does, step by step

skills/

How to do each task

tools/

Small programs it can run

Orchestration Writeup Language

**The language of FLOW.md.
English, with KEYWORDS.**

STEP 1: GATHER

ASK USER "What do you sell, and to which clients?"

SAVE answer INTO VARIABLE `target`

EXECUTE tool `scrape\_leads` with payload { "query": `target` }

SAVE result INTO VARIABLE `leads`

IF `leads` IS EMPTY THEN

 RETURN "No leads found. Try another city."

END IF

COMPILED

It refuses to build a broken flow.

```
FLOW.md:22: error: unknown keyword INVOCATE; did you mean INVOKE?
```

```
FLOW.md:26: error: EXECUTE tool `send_mail`: no such tool
```

```
FLOW.md:28: error: `pich` is used before it is set
```

Then your own LLM reviews the logic, before anything is built.

THE .BOT FILE

One file is the whole agent.

botcore Runtime: interpreter, HTTPS, sandbox	agent.md + FLOW.md Read-only, as written	skills/ Playbooks	tools/ Programs	checksum Tamper check
--	--	-----------------------------	---------------------------	---------------------------------

Static x86-64 Linux executable.
No install, no runtime, no dependencies.

Nothing is generated. It runs exactly the files you wrote. Built in 2.7 ms.

Checksummed. A truncated or modified file refuses to start.

— A BOTTER AGENT VS. AN OPENCLAW AGENT

Kilobytes and milliseconds. Not megabytes and seconds.

	BOTTER AGENT	OPENCLAW AGENT	DIFFERENCE
On disk	356 KB 1 file	646 MB 41,408 files	1,800× smaller
Ready in	1.2 ms	7.3 s	6,000× faster
Memory	0.4 MB	730 MB	1,800× lighter

Measured on the same laptop. OpenClaw 2026.9.9: default npm install (Node.js itself not counted), gateway start to accepting connections, idle memory. Botter: a minimal built agent, start to first prompt.

— BRING YOUR OWN KEY

Your model. Your key. Entered once.

Gemini

OpenAI

OpenRouter

Groq

Ollama (local)

Any OpenAI-compatible URL

The key is cached in the kernel keyring, in RAM only, until the machine reboots. No re-entering it on every run: ideal for agents that live on a server.

Safe by default. Private by design.

Sandboxed

Every tool and shell command runs under Landlock. The rest of your home directory is invisible.

Nothing phones home

No telemetry, no accounts, no update checks. One connection: the LLM provider you chose.

An offline switch

Set `"internet": false` and the kernel cuts the agent's tools off the network.

ONE MORE THING

Botter is a compiler, reimagined.

It is itself an agent.

So you never have to write this Markdown by hand. Describe the agent you want: Botter asks, plans, writes, checks and builds it.

Describe it. Build it. Ship one file.

```
$ botter
```

Describe the agent you want

```
$ ./myagent.bot
```

Run it on any x86-64 Linux
